

B1
a handle operably connected to the bag, the entire handle being on an opposite side of the vertical centerline from the pouring region.

B2
3. (Amended) The apparatus of claim 2, wherein the first sidewall is attached to the second sidewall at a region adjacent to the handle.

15. (Twice Amended) An apparatus for carrying and delivering pourable product, the apparatus comprising:

B3
a bag having first and second sidewalls, the sidewalls each being a single sheet of packaging material, an interior volume, an end edge, oppositely disposed corners formed along the end edge, a vertical centerline and a pouring region formed on one side of the vertical centerline;

pourable product positioned within the interior volume; and

a handle operably connected to the bag, the handle being adjacent one corner, and located entirely on an opposite side of the vertical centerline from the pouring region, and the pouring region adjacent to the oppositely disposed corner, the handle being defined by a hole passing through the first and second sidewalls.
